IS THE TEST ITEM COMPLETE?

Nothing missing
Each row must contain the user query, example response, inferior response, ground-truth preference, and rubric dimensions, including positive and negative signals.

Valid format
Recommendation rows must also include the candidate pool; agentic rows must also include the expected tool calls; the ground-truth preference must trace back to the user's real engagement history.

DOES IT READ LIKE A REAL CONVERSATION?

Sounds like a real person
The user's message reads like something an actual person would type to an assistant — not a robotic, fill-in-the-blank template.

Doesn't give itself away
The good answer doesn't announce what it knows ("since you love X…"). The personalization should show in WHAT it picks, not in name-dropping the user's traits.

Actually answers
The answer attempts the task instead of dodging it (e.g. "I don't have access to your data").

No behind-the-scenes text
The answer reads like a normal reply the user would see — no grading notes or internal instructions leaking through.

IS THE PERSONALIZATION REAL?

Truly needs this user
The good answer really depends on THIS user's history — it isn't a generic answer in disguise. (Skipped for trick questions where the right move is to NOT use stored info.)

Fair "don't overshare" test
For questions that test restraint, the good answer can be written generically, without leaning on private data.

Tests the right thing
The good answer actually addresses the specific preference the question was built to test.

Keeps private things private
The good answer never reveals a preference that was marked off-limits.

IS IT A FAIR COMPARISON?

Weaker answer fails the right way
The weaker alternative falls short on exactly the skill being tested — a believable mismatch for this user, not something obviously wrong.

Clue comes before the question
For planted sensitive-event questions, the clue appears BEFORE the test moment, so the model could realistically have seen it.
